

Informatics - Distance Learning (DL, Bachelor, 3 years) is for those who enjoy using, and programming computers, from Web sites or databases to desktop programs, but don't like electronics or Scopes, and have no time to attend school on a regular basis (those who are already hired).

The advantages are that the students get a degree in just three years, the curriculum is only about using and programming computers, the school is conducted with teachers from a great and prestigious Technical University.

The students will acquire skills to solve the real-life problems by using computer programs, or by creating new ones. They will know about using basic concepts of informatics, and dedicated computer programs, software design with different programming languages and environments, computer networks, a.s.o. They are trained for teamwork, as well.

The **DL** form of tuition is following the same curriculum as the same full-time form, often with the same teachers, but the students have to come to school only a Saturday per month. Diploma is the same! But the students must study more on their own and communicate with teachers and peers over the Net, via e-mail, blogs, forums, wi-ki, supported by the “*virtual campus*” at cv.upt.ro.
